Turbomachinery, in mechanical engineering, describes machines that transfer energy between a rotor and a fluid, including both turbines and compressors. While a turbine transfers energy from a fluid to a rotor, a compressor transfers energy from a rotor to a fluid. These two types of machines are governed by the same basic relationships including Newton's second Law of Motion and Euler's pump and turbine equation for compressible fluids. Centrifugal pumps are also turbomachines that transfer ene

Fluid Machines (machines are energy conversion devices) are called Turbo-machinery which transfers energy between a fluid system and its mechanical system (e.g. rotor). Two primary categories of Turbo-machinery are: 1. Turbines which extract hydraulic energy available in a fluid and convert it into mechanical energy (power) to rotate a shaft. 2.
