Forging Manufacturing Design Considerations: For parts manufactured by forging that are produced in two-part impression dies, the designer should take into account the following: the parting line, the draft, the presence of ribs, bosses, webs, and recesses, and the machining allowance. Rib height forging manufacturing design - the ratio of rib height (H) to thickness (T) in general should not exceed 6:1.

Design For Forging Manufacturing Considerations ...

The forging design is not a simple task. There are infinite combinations of various factors possible, such as properties of material being forged, type of forging process, the tool design, die manufacturing methods etc. Following are some recommended forging design principles: 1. Parting Line 2. Draft 3. Ribs 4. Webs 5. Corner Radii 6. Fillet Radii 7.

A rough rule of thumb for finish stock is at least 5 mm (0.2 inch) of machining envelope for each 300 mm (12 inches) of dimension for blocker type forgings made from steel. The allowance can be less for aluminum, and should be 25% to 50% more for heat resistant alloys. Draft angles are typically 7deg. to 10deg.

Forging process refers to all the steps that engineers and technicians use to shape the metal into a desired shape. In the modern manufacturing process, it is to produce complex shapes with minimal secondary operations. At times, they may not be manufactured using a single metal forging technique.

5. Draft angles should be the maximum allowable, consistent with functional, assembly and weight constraints. For ferrous forgings, draft angles less than 5° usually prohibit the use of hammers. Dies installed in presses are usually equipped with knock-out pins to eject the forging from the cavity, and can produce forgings with little or no draft. 6.

In practice, open-die forging comprises many process variations, permitting an extremely broad range of shapes and sizes to be produced. In fact, when design criteria dictate optimum structural integrity for a huge metal component, the sheer size capability of open-die forging makes it the clear process choice over non-forging alternatives.

Hailed as a groundbreaking and important textbook upon its initial publication, the latest iteration of Product Design for Manufacture and Assembly does not rest on those laurels. In the industrial design and engineering field, product lifecycle, product development, design process, Design for X, etc., constitute only a small sample of terms related to the generation of quality products. Current best practices cover widely different knowledge domains in trying to exploit them to the best advantage, individually and in synergy. Moreover, standards become increasingly more helpful in interfacing these domains and they are enlarging their coverage by going beyond the single domain boundary to connect closely different aspects of the product lifecycle. The degree of complexity of each domain makes impossible the presence of multipurpose competencies and

skills; there is almost always the need for interacting and integrating people and resources in some effective way. These are the best conditions for the birth of theories, methodologies, models, architectures, systems, procedures, algorithms, software packages, etc., in order to help in some way the synergic work of all the actors involved in the product lifecycle. This brief introduction contains all the main themes developed in this book, starting from the analysis of the design and engineering scenarios to arrive at the development and adoption of a framework for product design and process reconfiguration. In fact, the core consists of the description of the Design GuideLines Collaborative Framework (DGLs-CF), a methodological approach that generates a collaborative environment where designers, manufacturers and inspectors can find the right and effective meeting point to share their knowledge and skills in order to contribute to the optimum generation of quality products.
