Assuming a uniform distribution of data, the parallel run time is: $TP = n p \log n p + (p \log^2 p) + p \log n p + (n/p) + O(p \log p)$ The isoefficiency function of this formulation is $(p^2 \log p)$. 31 Recall that the parallel runtime is $TP = b r 2r ((\log n) + (n))$ (9.2) The optimal value of r is such that it minimizes Equation 9.2.
