Metallic magnetic thin films are an active and vibrant area of scientific research that provides the underpinning for many technological advances. Much of this interest is focused on films less than 50 nm thick, which has guided the choice of work

This study presents a general 3D nanofabrication technique, the focused ion beam stress induced deformation process, which allows a programmable and accurate bidirectional folding ( $-70^{\circ}$ – $+90^{\circ}$ ) of various metal and dielectric thin films. Using this method, 3D helical optical antennas with different handedness, improved surface smoothness, and tunable
